

DAY 2 GEORGE PARKINSON 21/04/20

Today's topic is about plants that my mum has grown from babies, the first one is a spider plant- today I will talk about the spider plant.....

Here is my mums spider plant. She grew this from a baby like the ones you see hanging from the plant.

A FACT!!!!!!

they're one of the easiest and rewarding indoor plants you can grow in your home.

Spider Plants, known as Chlorophytum, are easy to grow houseplants they are very easy and straightforward to care for

MY MUM, USUALLY KILLS PLANTS! MY DAD MADE A BET WITH HER THAT SHE COULDN'T GROW THIS PLANT!! HE LOST THE BET AS YOU CAN SEE!!!!

The spider plant is very interesting it can breed itself!!! My mum has given away 7 babies already!!! My sister Jade has already made 5 plants!! Just from my mums!!! It is said that the mother plant will often root with a very high success rate.

I like the spider plant, luckily im not scared of spiders!!! My mums not scared of spiders!! She will not kill spiders... she chucks them out of the window. Sometimes she even names them! There seems to be a lot of spiders called FRED!!! My sister Megan though, screams and stamps on them!!! I think she is mean... 😞

DO YOU THINK THEY LOOK THE SAME???

SO WHERE DO SPIDER
PLANTS COME
FROM???????

Spider plants are an evergreen, perennial herb and are generally grown for their long arching foliage. Spider plants are native to the **African tropics and southern Africa**

SPIDER PLANTS ARE PART OF
THE ASPARAGUS FAMILY!!!
